

# **Lab Report 5 – DETERMINATION OF $g$ BY PENDULUM**

---

**XUAN MAI TRAN**

02/13/2025

-

PHYS 2125

-

DR. JOSEPH BARCHAS

## Objectives

To measure the period of a simple pendulum and use it to predict local acceleration due to gravity.

## Equipments

The list of equipments used in this experiment is:

- Lab stand
- Pendulum clamp
- String
- Spherical mass
- Meter stick
- Stopwatch

## Theory and Equations

### 1. Pendulum's Oscillation

At the equilibrium state, the mass is at rest and the string hangs vertically as there is a balance between the gravity force and the string force which holds the mass.

When we pull the mass, then release it, so that it can be displaced from the equilibrium. The mass will oscillate back and forth.

$T$  is the time interval between 2 states that share the same position and velocity (for instance, the time interval between state a and e).

If the oscillation is small ( $\leq 10$  degrees), we can predict the value of  $T$  in theory that depends only on the length of the pendulum and local gravity acceleration as below:

$$T = 2\pi\sqrt{\frac{L}{g}} \quad (\text{Eq. 1})$$

With L is the distance from the fixed attachment point of the string to the center of the spherical mass.

## 2. Percentage Difference

After the experiments, we will get 2 different values of g, then we can calculate the average value of g:

$$\text{Percentage Difference} = \left| \frac{g_1 - g_2}{\frac{1}{2}(g_1 + g_2)} \right| * 100\% \quad (\text{Eq. 2})$$

## 3. Percentage Error

The percentage error is calculated based on the experimentally determined measure (exp) and the accepted value (acc). And there are 2 types of accepted values which are theoretical value which is predicted from theory and empirical value which is collected from a reliable source.

$$\text{Percentage Error} = \left| \frac{(\text{exp}) - (\text{acc})}{(\text{acc})} \right| * 100\% \quad (\text{Eq. 3})$$

## Summary of Procedures

First, we set up a stable surface with some measuring tools. We place the foot of the Lab Stand aligned with the outer edge of the table to keep the string's direction in a clear space, so that we can freely adjust the length of the string. Next, we attach the mass to about 2 meters of string, and attach the other end of the string to the pendulum clamp. We use a meter stick to confirm the length (L) of the string (the distance is from the attachment point to the center of the mass).

We gently pull the mass to the side and release it. Then, we use a stopwatch to measure the time interval for 10 periods. We repeat the same process by changing the length of the pendulum with a shorter string of about 5 cm until the value of L is close to 0.500m. This will take about 30 trials.

## Data and Observations

L is string length (units: meter) and T is Time (10 periods, units: seconds)

| Id | String Length (m) | Time (10 Periods) (s) |
|----|-------------------|-----------------------|
| 1  | 1.950             | 28.30                 |
| 2  | 1.900             | 28.30                 |
| 3  | 1.850             | 27.37                 |
| 4  | 1.800             | 26.68                 |
| 5  | 1.750             | 26.36                 |
| 6  | 1.700             | 26.30                 |
| 7  | 1.650             | 25.87                 |
| 8  | 1.600             | 25.26                 |
| 9  | 1.550             | 25.11                 |
| 10 | 1.500             | 24.65                 |
| 11 | 1.450             | 26.95                 |
| 12 | 1.400             | 24.14                 |
| 13 | 1.350             | 23.73                 |
| 14 | 1.300             | 23.08                 |
| 15 | 1.250             | 22.43                 |
| 16 | 1.200             | 22.40                 |
| 17 | 1.150             | 22.20                 |
| 18 | 1.100             | 21.56                 |
| 19 | 1.050             | 20.30                 |
| 20 | 1.000             | 20.57                 |
| 21 | 0.950             | 19.60                 |
| 22 | 0.900             | 19.18                 |
| 23 | 0.850             | 18.75                 |
| 24 | 0.800             | 18.18                 |
| 25 | 0.750             | 17.65                 |
| 26 | 0.700             | 15.45                 |
| 27 | 0.650             | 16.32                 |
| 28 | 0.600             | 15.93                 |
| 29 | 0.550             | 15.14                 |
| 30 | 0.500             | 14.56                 |

## Data Analysis

**Method 1:** Using the Eq. 1 of period formula, we have an example calculation for the id = 1:

$$T/10 = \frac{28.30}{10} = 2.830$$

$$g = \frac{4\pi^2 L}{T^2} = \frac{4\pi^2 (1.950m)}{(2.830s)^2} = 9.612 m/s^2$$

| Id | String Length (m) | Time (10 Periods) (s) | T/10 (s) | g (m/s <sup>2</sup> ) |
|----|-------------------|-----------------------|----------|-----------------------|
| 1  | 1.950             | 28.30                 | 2.830    | 9.612                 |
| 2  | 1.900             | 28.30                 | 2.830    | 9.366                 |
| 3  | 1.850             | 27.37                 | 2.737    | 9.749                 |
| 4  | 1.800             | 26.68                 | 2.668    | 9.983                 |
| 5  | 1.750             | 26.36                 | 2.636    | 9.943                 |
| 6  | 1.700             | 26.30                 | 2.630    | 9.703                 |
| 7  | 1.650             | 25.87                 | 2.587    | 9.733                 |
| 8  | 1.600             | 25.26                 | 2.526    | 9.899                 |
| 9  | 1.550             | 25.11                 | 2.511    | 9.705                 |
| 10 | 1.500             | 24.65                 | 2.465    | 9.746                 |
| 11 | 1.450             | 26.95                 | 2.695    | 7.882                 |
| 12 | 1.400             | 24.14                 | 2.414    | 9.484                 |
| 13 | 1.350             | 23.73                 | 2.373    | 9.465                 |
| 14 | 1.300             | 23.08                 | 2.308    | 9.635                 |
| 15 | 1.250             | 22.43                 | 2.243    | 9.809                 |
| 16 | 1.200             | 22.40                 | 2.240    | 9.442                 |
| 17 | 1.150             | 22.20                 | 2.220    | 9.212                 |
| 18 | 1.100             | 21.56                 | 2.156    | 9.342                 |
| 19 | 1.050             | 20.30                 | 2.030    | 10.06                 |
| 20 | 1.000             | 20.57                 | 2.057    | 9.330                 |
| 21 | 0.950             | 19.60                 | 1.960    | 9.763                 |
| 22 | 0.900             | 19.18                 | 1.918    | 9.658                 |
| 23 | 0.850             | 18.75                 | 1.875    | 9.545                 |
| 24 | 0.800             | 18.18                 | 1.818    | 9.556                 |
| 25 | 0.750             | 17.65                 | 1.765    | 9.505                 |
| 26 | 0.700             | 15.45                 | 1.545    | 11.58                 |
| 27 | 0.650             | 16.32                 | 1.632    | 9.635                 |
| 28 | 0.600             | 15.93                 | 1.593    | 9.334                 |
| 29 | 0.550             | 15.14                 | 1.514    | 9.473                 |
| 30 | 0.500             | 14.56                 | 1.456    | 9.311                 |

$$g_{average} = \frac{\sum_{i=1}^{30} g_i}{30} = 9.615$$

**Method 2:** Using a graph of T versus L

| String Length (m) | T/10 (s) |
|-------------------|----------|
| 1.950             | 2.830    |
| 1.900             | 2.830    |
| 1.850             | 2.737    |
| 1.800             | 2.668    |
| 1.750             | 2.636    |
| 1.700             | 2.630    |
| 1.650             | 2.587    |
| 1.600             | 2.526    |
| 1.550             | 2.511    |
| 1.500             | 2.465    |
| 1.450             | 2.695    |
| 1.400             | 2.414    |
| 1.350             | 2.373    |
| 1.300             | 2.308    |
| 1.250             | 2.243    |
| 1.200             | 2.240    |
| 1.150             | 2.220    |
| 1.100             | 2.156    |
| 1.050             | 2.030    |
| 1.000             | 2.057    |
| 0.950             | 1.960    |
| 0.900             | 1.918    |
| 0.850             | 1.875    |
| 0.800             | 1.818    |
| 0.750             | 1.765    |
| 0.700             | 1.545    |
| 0.650             | 1.632    |
| 0.600             | 1.593    |
| 0.550             | 1.514    |
| 0.500             | 1.456    |

Following to the Eq. 1, we have

$$T \sim 2\pi\sqrt{\frac{L}{g}}$$

Graph of  $T$  versus  $L$

$$g = 9.58756 \text{ m/s}^2$$

$$R^2 = 0.9798$$

## Outlier Analysis

Outliers:

7.882, 11.58

## Step-by-step calculation

### Method: Tukey's fences

How to calculate Q1 and Q3? go to [Q1 and Q3 step by step calculation](#).

Q1 = **9.442**.

Q3 = **9.749**.

IRQ = Q3 - Q1 = 9.749 - 9.442 = **0.307**.

Lower = Q1 - k \* IRQ = 9.442 - 1.5 \* 0.307 = **8.9815**.

Upper = Q3 + k \* IRQ = 9.749 + 1.5 \* 0.307 = **10.2095**.

Sample size (n) = **30**.

Outlier count: **2**.

**Outliers: 7.882, 11.58.**

Source: <https://www.statskingdom.com/outlier-calculator.html>

## Results

### Percentage Error

Based on the Eq. 3, we can calculate the difference between the experimental value and the accepted value of g in both methods above.

|   |       |
|---|-------|
| Accepted value of g (m/s <sup>2</sup> ) | 9.800 |
|---|-------|

- Method 1**

$$\text{Percentage Error} = \left| \frac{(exp) - (acc)}{(acc)} \right| * 100\% = \left| \frac{9.615 - 9.800}{9.800} \right| * 100\% = 1.886 \%$$

- Method 2**

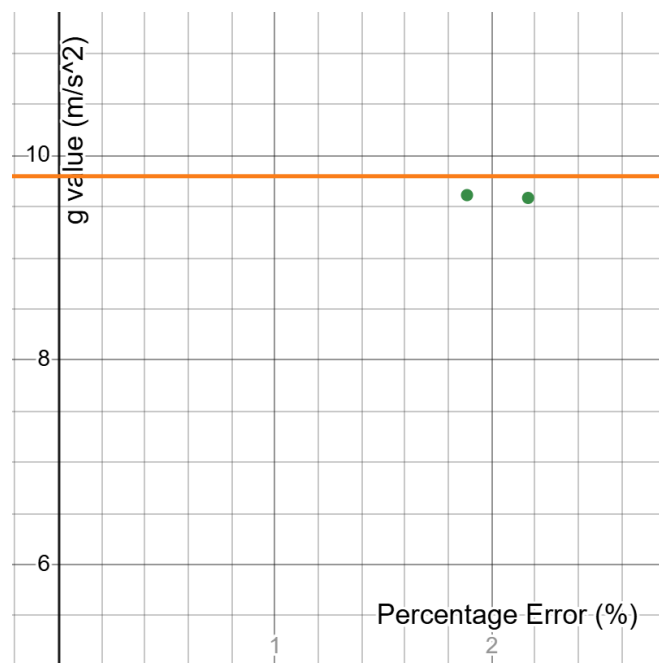

$$\text{Percentage Error} = \left| \frac{(exp) - (acc)}{(acc)} \right| * 100\% = \left| \frac{9.58756 - 9.800}{9.800} \right| * 100\% = 2.168 \%$$

### Percentage Difference

Based on the Eq. 2, we now want to see the difference between those two (g) values we got from the 2 methods above.

$$\text{Percentage Difference} = \left| \frac{9.615 - 9.58756}{\frac{1}{2}(9.615 + 9.58756)} \right| * 100\% = 0.2858 \%$$

|          | Percentage Error (%) | g (m/s <sup>2</sup> ) |
|----------|----------------------|-----------------------|
| Method 1 | 1.886                | 9.615                 |
| Method 2 | 2.168                | 9.58756               |

*Comparison between g values of 2 methods*

## Discussion / Conclusion

Based on the percentage error results, we see that the above two methods used to measure the value ( $g$ ) are quite accurate with an error of less than 3%. Looking at the data and the graph of “Comparison between  $g$  values of 2 methods,” we can see obviously that the ( $g$ ) value in these methods are very close to the accepted value of  $g$  ( $9.800 \text{ m/s}^2$ ).

Although these 2 ( $g$ ) values are close to each other with a small percentage difference of 0.2858%, method 1 seems to have a slightly more accurate value (closer to the accepted value of  $g$  - the orange horizontal line on the graph) than the ( $g$ ) value of method 2 (method 1 has ( $g$ ) value of 9.615 compared to method 2's ( $g$ ) value of 9.58756).

However, we cannot conclude that method 1 is more accurate than method 2. To explain this confusion, we need to observe the “Graph of  $T$  versus  $L$ ” and the Outlier Analysis section. There are 2 significant outlier ( $g$ ) values of  $7.882 \text{ m/s}^2$  and  $11.58 \text{ m/s}^2$ . These outliers which might come from human error when using the stopwatch significantly affect the value of ( $g$ ) average.

While method 2's model has a high value of  $R^2$  of 0.9798, it means nearly 98% of data fit to the model or explained well by the model. Hence, we can say that method 2 which uses a function to estimate the ( $g$ ) value is more accurate than method 1.

In summary, the mean formula affected by outliers will be less accurate in estimating the value of ( $g$ ), especially when the experiment involves manual measurement methods, while the function method is more objective and accurate in estimating the value of ( $g$ ). To improve the measurement method in this case, there are many solutions, such as using automatic devices.

However, if there is no automatic device, we can use some tools, such as a string or a stick to mark the position of the oscillation state, so that we can better measure the time without relying on eye estimation. Then, we place a mini sponge on the phone screen, right at the “stop” button of the stopwatch. At the last count of the time cycle (the 10th oscillation), we align the phone with the marked string/stick (used to mark the angle of the last oscillation state), the ball will touch the “stop” button on the phone for us. This will reduce the chance of appearing outliers.

## Post-Lab Question

$$1^{\circ} = \frac{2\pi}{360} = \frac{\pi}{180} = 0.0175 \text{ rad}$$

$$\Rightarrow 10^{\circ} = \frac{2\pi}{360} * 10 = \frac{\pi}{180} * 10 = 0.175 \text{ rad}$$

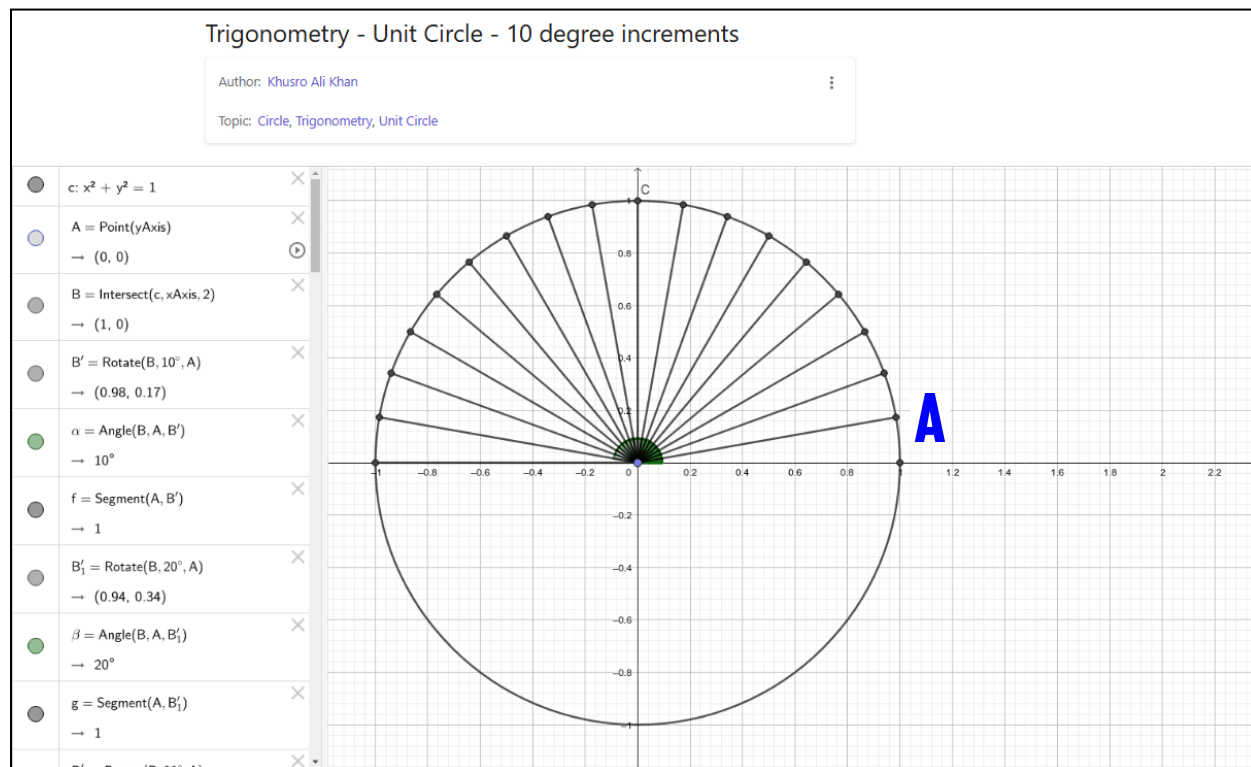

$$\sin(10^{\circ}) = \sin(0.175) = 0.174 \text{ rad}$$

To compare the value of  $10^{\circ}$  and  $\sin(10^{\circ})$ , we use the Eq. 2 as below

$$\text{Percentage Difference} = \left| \frac{0.175 - 0.174}{\frac{1}{2}(0.175 + 0.174)} \right| * 100\% = 0.57\%$$

We can clearly see that the value of  $10^{\circ}$  and  $\sin(10^{\circ})$  are approximate to each other with a very small percentage difference of less than 1%.

To explain this, we can use the Trigonometry circle as below.

*Trigonometry - Unit Circle - 10 degree increments (Source: geogebra.org)*

In the case of the angle of  $10^\circ$ , it lies on the 1st Quadrant, so its positive value is reasonable.

We mark the angle of  $10^\circ$  at point A on the graph above and have:

$$\sin(10^\circ) = \frac{\text{opposite length}}{\text{hypotenuse length}} = \frac{y_A}{\text{radius}} = y_A \quad \text{Eq. 4}$$

As the angle of  $10^\circ$  is too small, so we can see that the arc (angle) is approximate to the chord ( $y_A$ ).

Hence, we have an approximation of Eq. 4 as below:

$$\sin(10^\circ) = y_A = \text{chord} \sim \text{angle} \sim 10^\circ \sim 0.175 \text{ rad}$$
